ABSTRACT

The main aim of this project is to implement a code protected lock that provides a great benefit over a traditional lock, as well as great security. The system consists of a keypad, LCD along with a microcontroller and servo motor. Users can perform operations such as opening and closing the lock changing the current password through the keypad.

This project is to make a lock which will ensure security as well as cost efficient implementation. Code protected lock comprises of keypad as input, LCD display as output device and micro controller as controlling unit. The lock system is protected by a password/code which is set by the user. The lock is opened only when the correct code is inserted. On the other hand, password, changing option is somehow more security, that code along with the old code is needed. Thus, the enhanced security of the system is ensured.
