ABSTRACT

Reservoirs provide us with a wide range of social, economic, environmental benefits by helping us in controlling the flow of water, flood control, waste management etc. India has progressed a lot in construction of Reservoirs after Independence and now we are among the best builders in the world. But even today most of the Reservoirs use the conventional methods for controlling the reservoirs gates and maintenance. In the current fast paced modern world we are trying to automate all the processes around us, it's high time to revamp the management of our reservoirs using Internet of Things (IoT). We have proposed and implemented a novel idea of automating the process of management from collecting the data of water level by using Ultrasonic sensor and NodeMCU. This idea will help us to streamline the control of Reservoirs throughout the state and reduce the manpower for reservoirs maintenance.
